10" barrel with 5/8-11 threads on top. Turbo segments for fast coring. You must adhere to the RPM's we recommend. Unlike the other dry core bits on market that are only for concrete block, this barrel has no vent holes, so you can use a vacuum system. We also offer 18mm to 5/8-11 thread adapter @\$45.00 list.

Many customers proclaim the wonder of this core bit. We have hardly any segment loss. You can not put on right angle grinder and turn at 7 to 9000 rpm's.

Here you see our Dry cured corebit (yellow) along side a standard dry core bit that was designed years ago for concrete masonry block (that is a whole lot softer). Our bit goes thru that block along with poured concrete in less time than you would think, (about 3 minutes for a 3" thru 8" poured wall) The slots in the other bit just weakens the barrel. It does not do what they that it would do, "cool". You can not rebuild the black type barrel when it wears the segments out because the barrel is too thin, but you can our solid barrel, (yellow). So our yellow bit comes out to be the better value. It has no .100 backer pad. Segments are LASER WELDED.

Fire sprinkler installers love our yellow core bits, solves a lot of issues, LIFE of bit.
